

# Characterizing Cosmic Dawn with the Low-Band EDGES Instrument

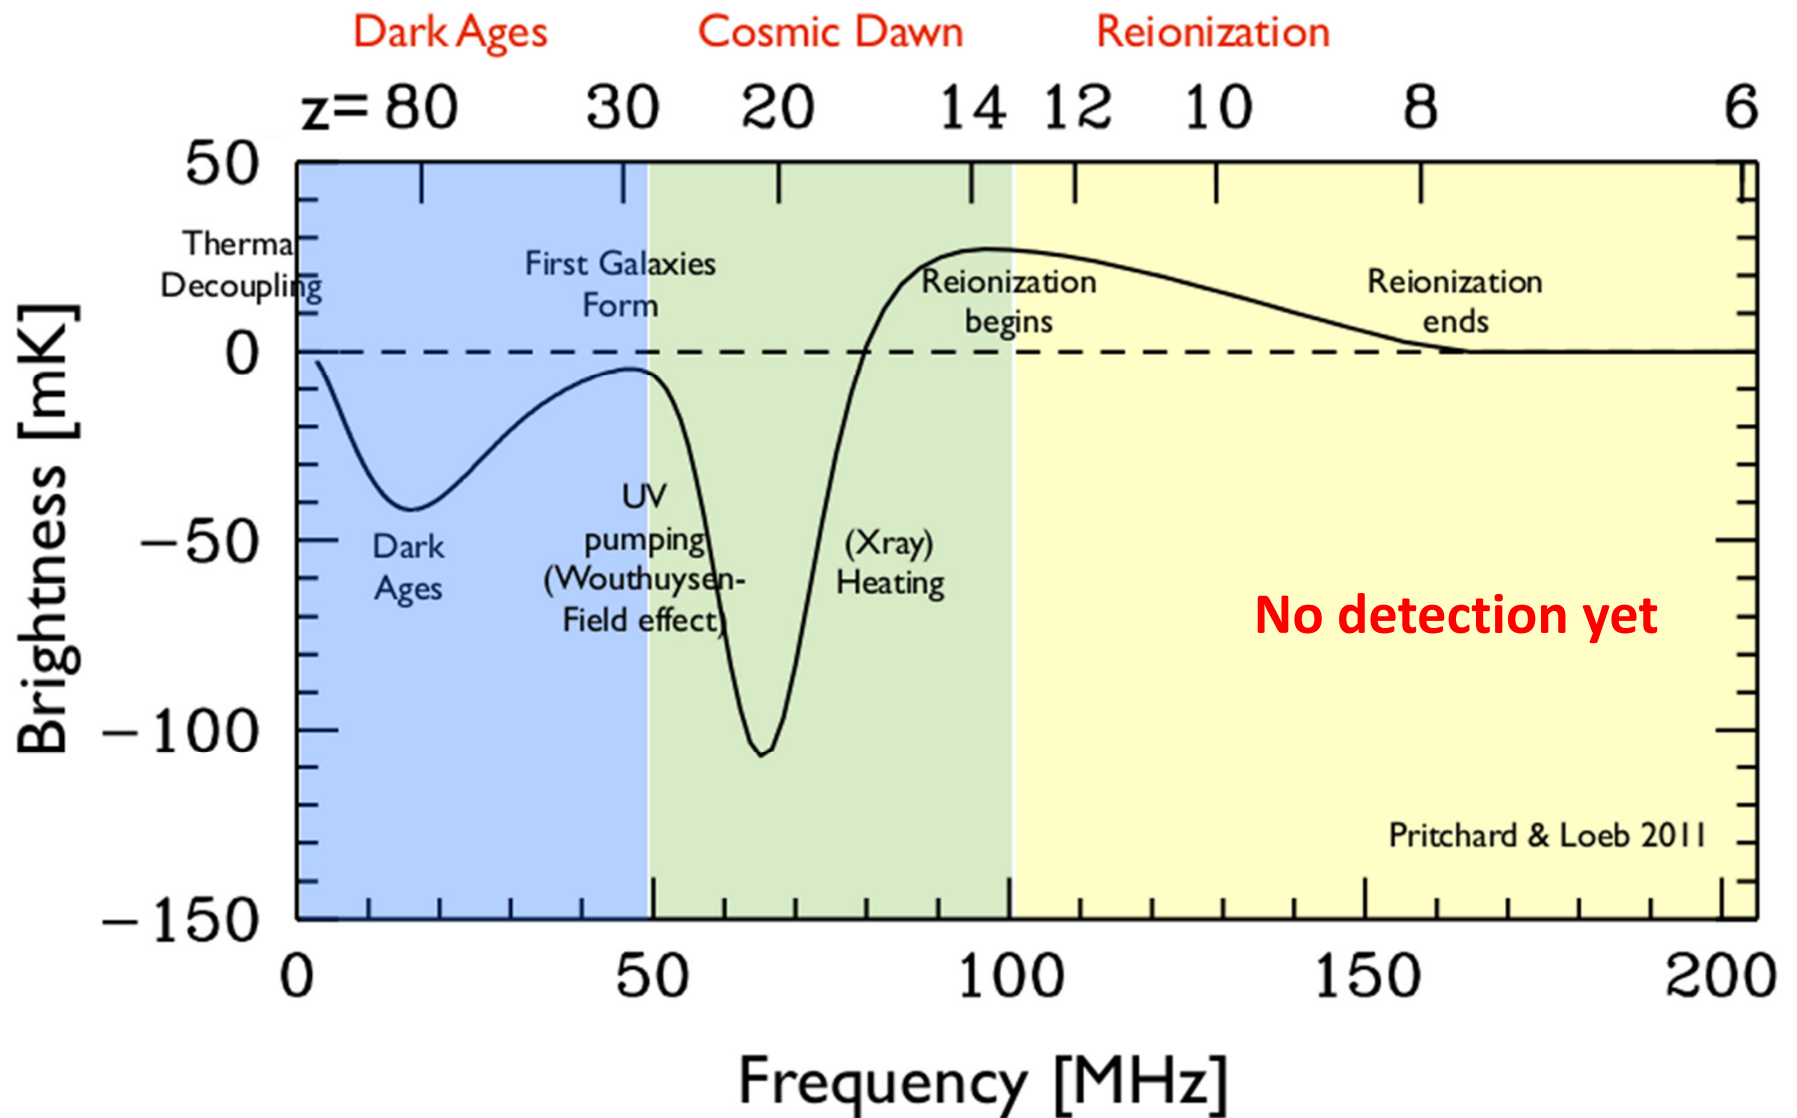

**Raul Monsalve**

Arizona State University

Prof. Judd Bowman, Thomas Mozdzen, Dr. Alan Rogers

# Science

# EDGES

(& Cosmic Dawn)

## Experiment to Detect the Global EoR Signature

- EDGES-I (2008 - 2012), Bowman & Rogers (2010) (Nature Journal)
- EDGES-II (2012 - Present)
- Starting 2015, **TWO** independent instruments:

Low-Band  
**50-100 MHz**

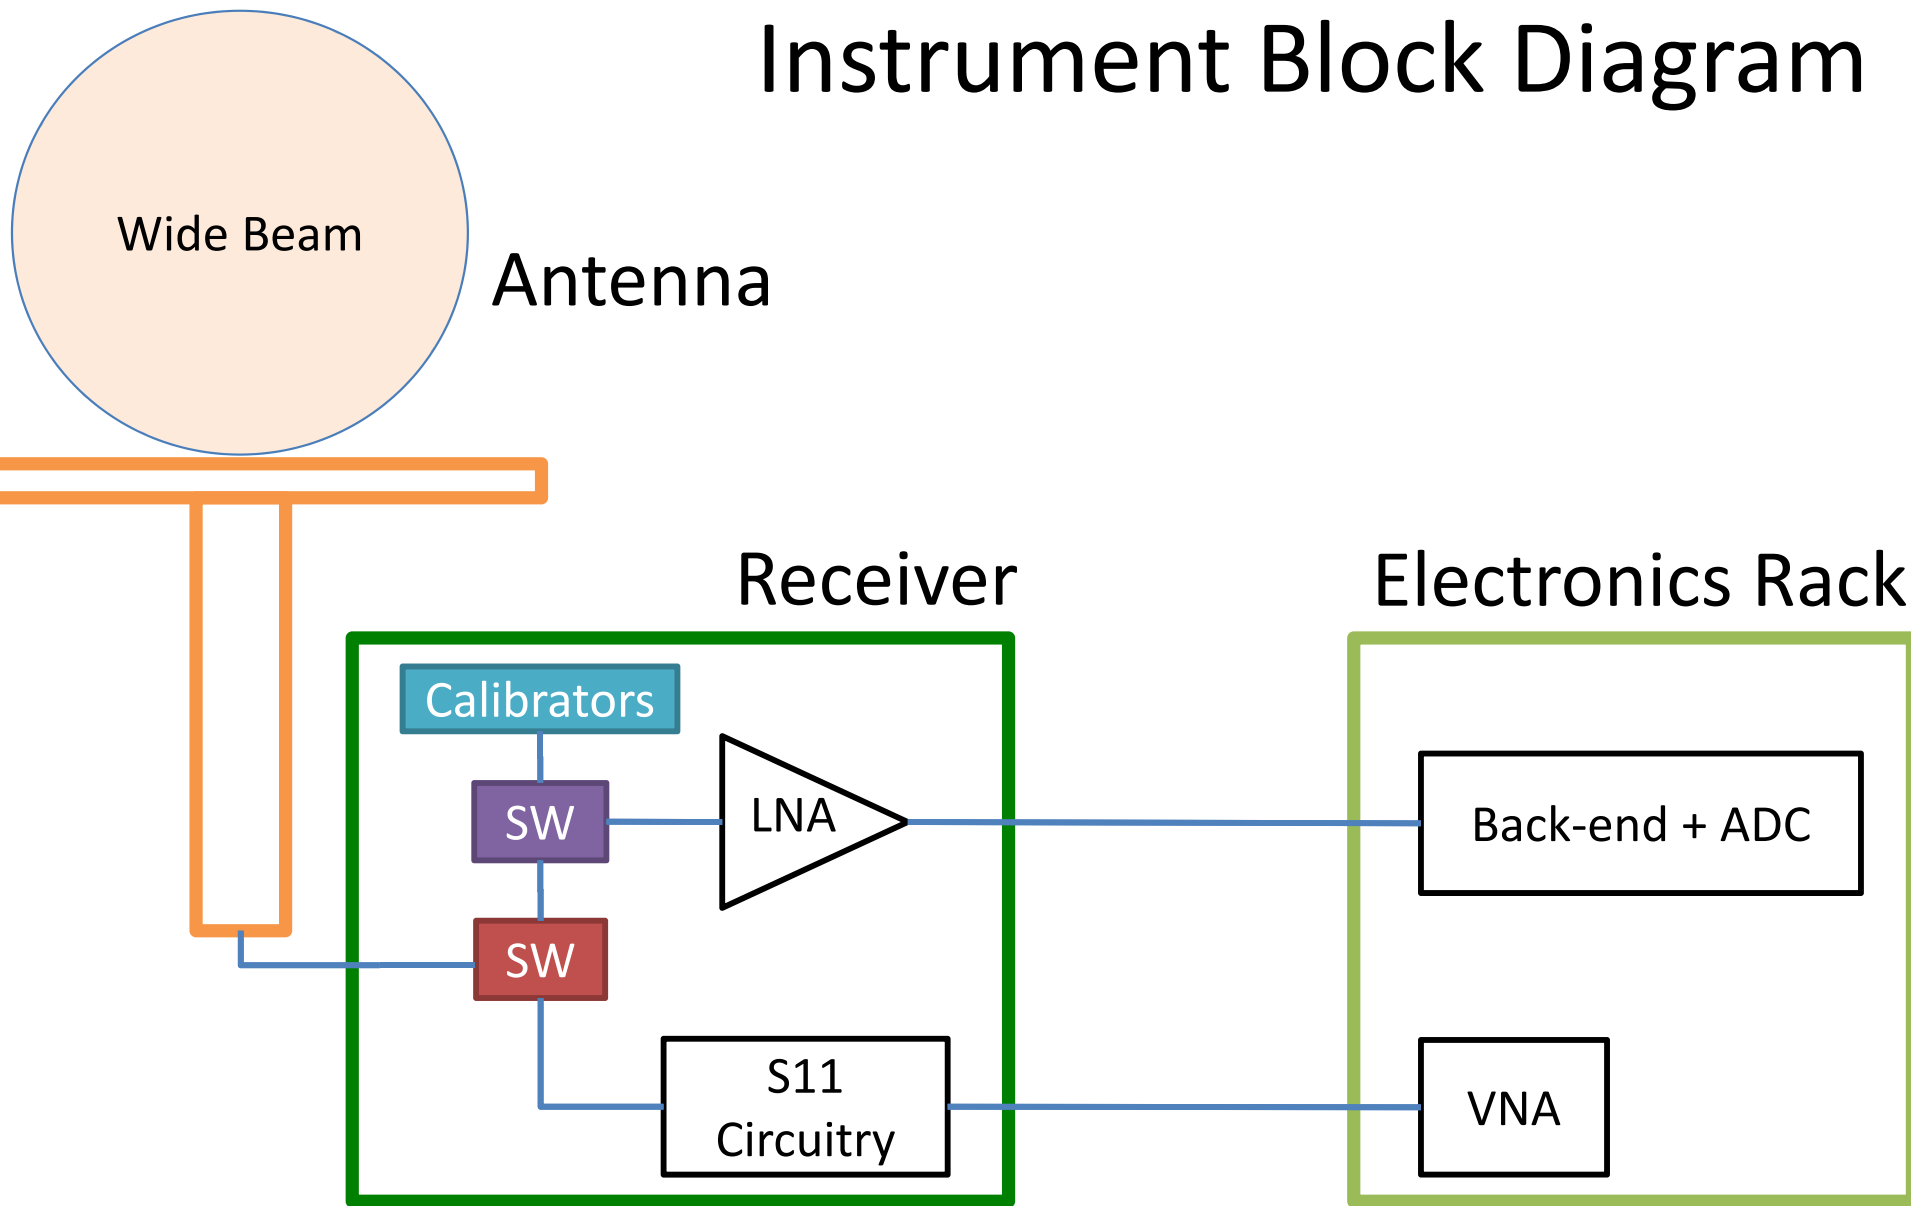

and

High-Band  
**100-200 MHz**

# Radio-Quiet Location: **Murchison, WA**

# Instrument Block Diagram

# EDGES **Low-Band** 2015

# EDGES **Low-Band** 2015

# Low-Band Reflection Coefficients

# Calibrated Antenna Temperature

# Models

## Regular Polynomial:

$$\hat{T}_{\text{ant}} = \sum_{i=0}^N a_i v^i$$

## “EDGES” Polynomial:

$$\hat{T}_{\text{ant}} = v^{-2.5} \sum_{i=0}^N a_i v^i$$

## Log-Log Polynomial:

$$\log(\hat{T}_{\text{ant}}) = \sum_{i=0}^N a_i \cdot [\log(v)]^i$$

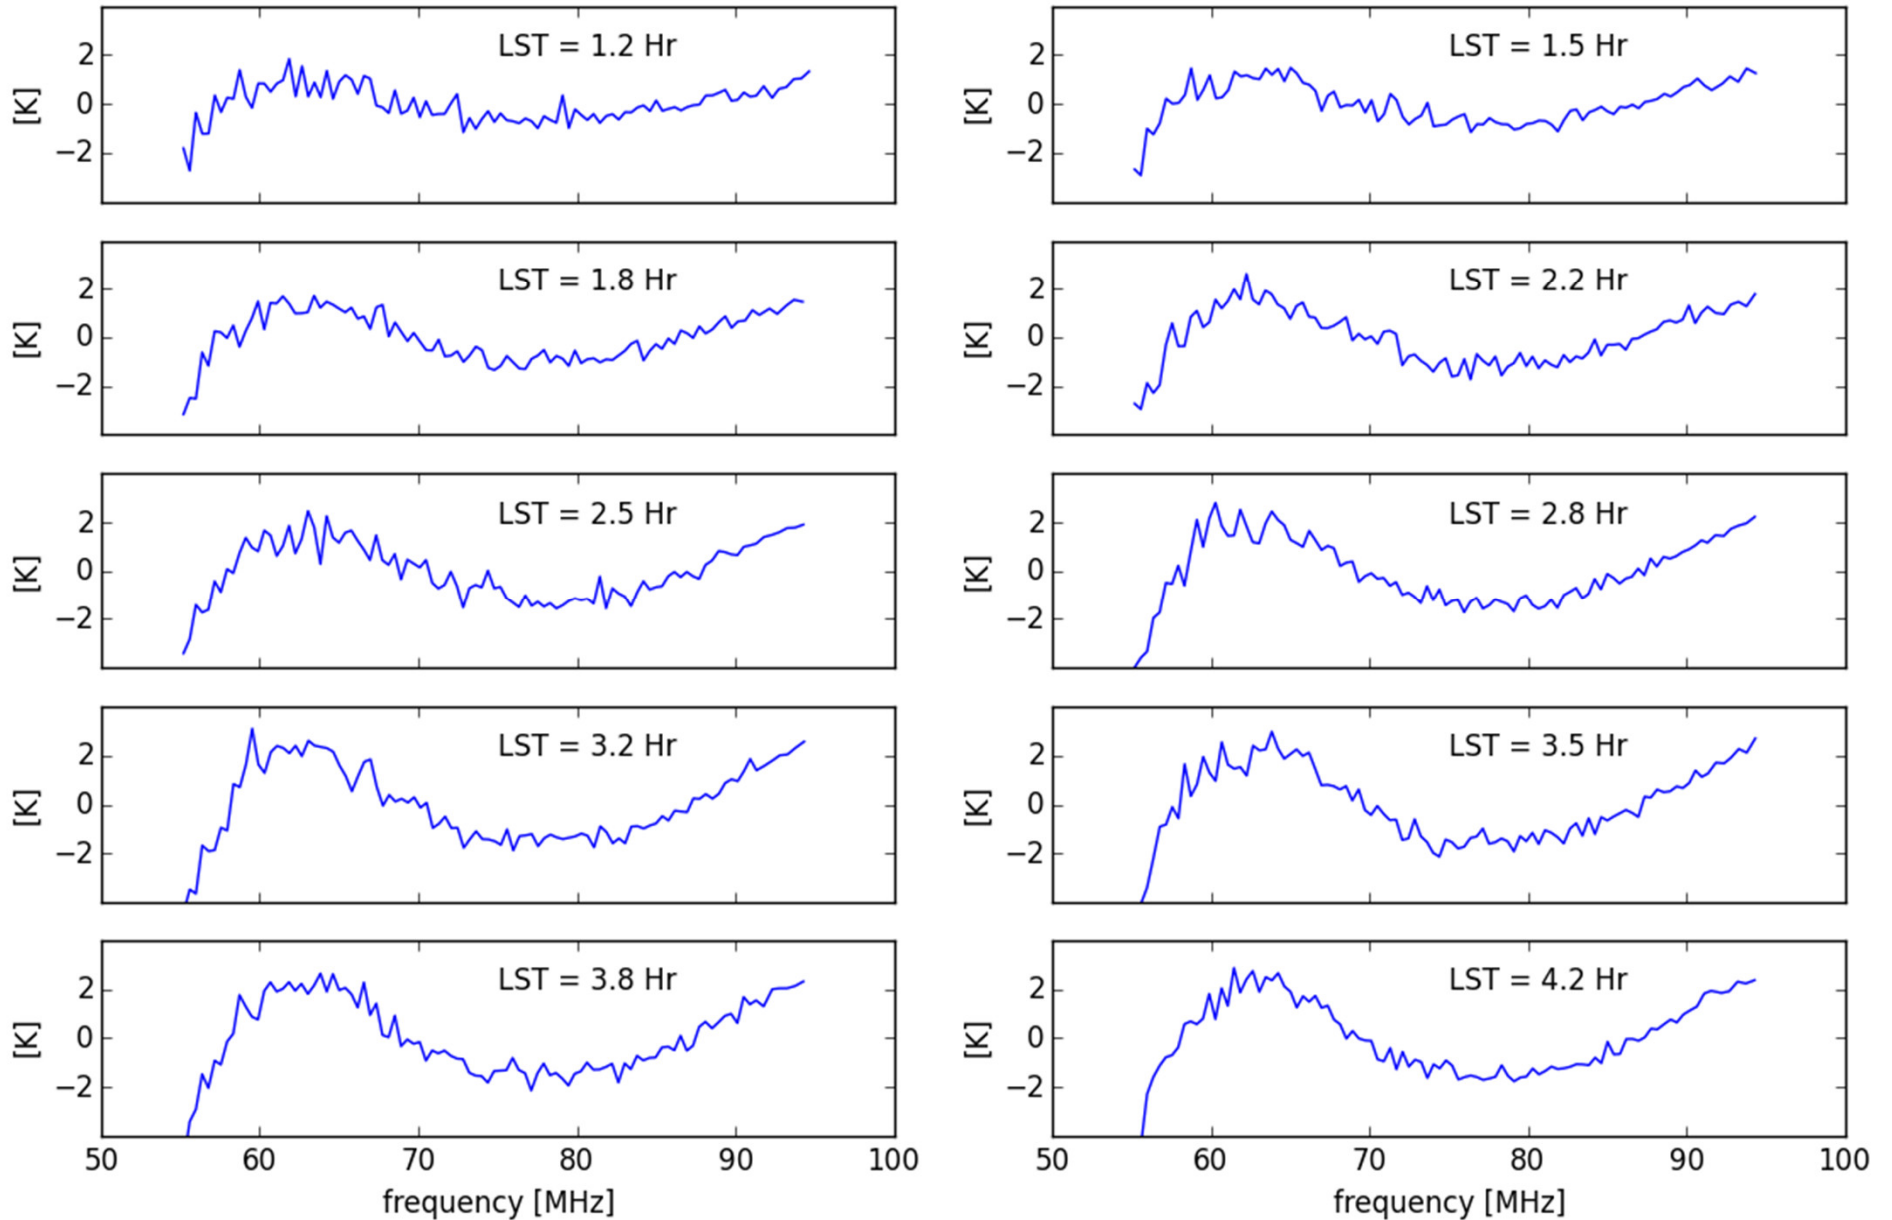

## “Physical” Polynomial:

3 parameters for sky foreground

2 parameters for ionospheric absorption/emission

# Sample: Removing “EDGES” Polynomial with 3 Terms

5-day average at each 20-minute LST bin. For presentation purposes only.

# Sample: Removing “EDGES” Polynomial with 5 Terms

5-day average at each 20-minute LST bin. For presentation purposes only. RMS  $\sim$  350 mK.

# Status of Analysis

Amount of data with blade antennas to date:

- **High Band:** 120 Days
- **Low Band:** 50 Days

After data selection and averaging, RMS residuals:

- **High Band:** ~ 30 mK
- **Low Band:** ~ 100 mK
- After removing 5 model terms
- Not limited by noise

# Status of Analysis

- We have achieved residuals of **same order of magnitude** as expected **cosmological signal**.
- Conducting a thorough set of **validation** tests, **cross-checks**, sensitivity **analyses**.
- As **more data** are gathered, the understanding of limits **will improve**.
- In parallel, we are preparing to **rule out extreme** cosmological **scenarios**.
- Preparing to **rule out EoR durations** in the range  $0.5 < \Delta z < 1.0$  for certain ranges of reference redshifts. Factor of  $\sim$  **10 improvement** wrt results from 2010.

# Summary

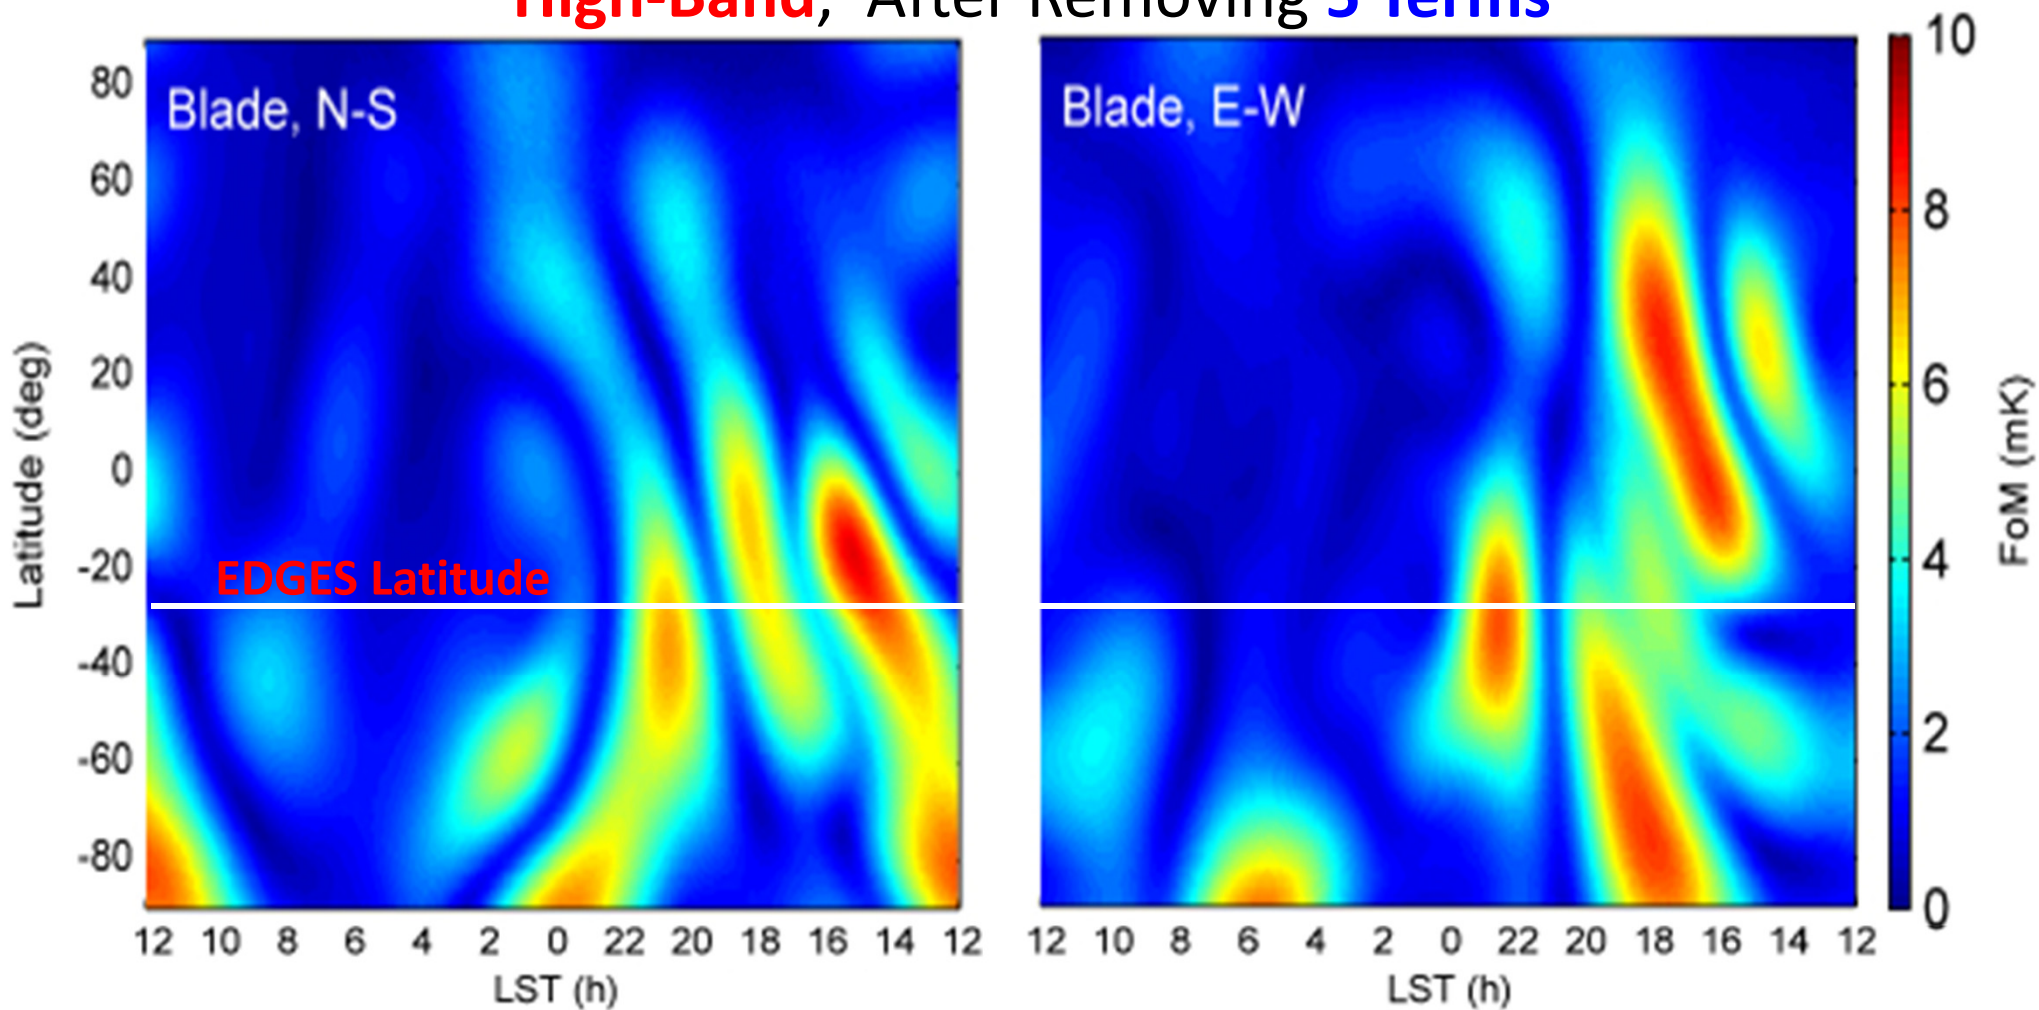

- **Two** EDGES instruments.
- Conducting continuous **sky measurements**.
- Data model requires  $\geq 5$  **terms** due to imperfect knowledge of **Foregrounds / Ionosphere / Antenna Beam / Antenna Losses / Calibration Systematics**.
- **Current residuals** of **same order of magnitude** as **cosmological signal**.
- Stay tuned for **papers** in the **next few months**.

# Backup Slides

# New “Blade” Antenna Performance

High-Band, After Removing 5 Terms

# EDGES **High-Band** 2015

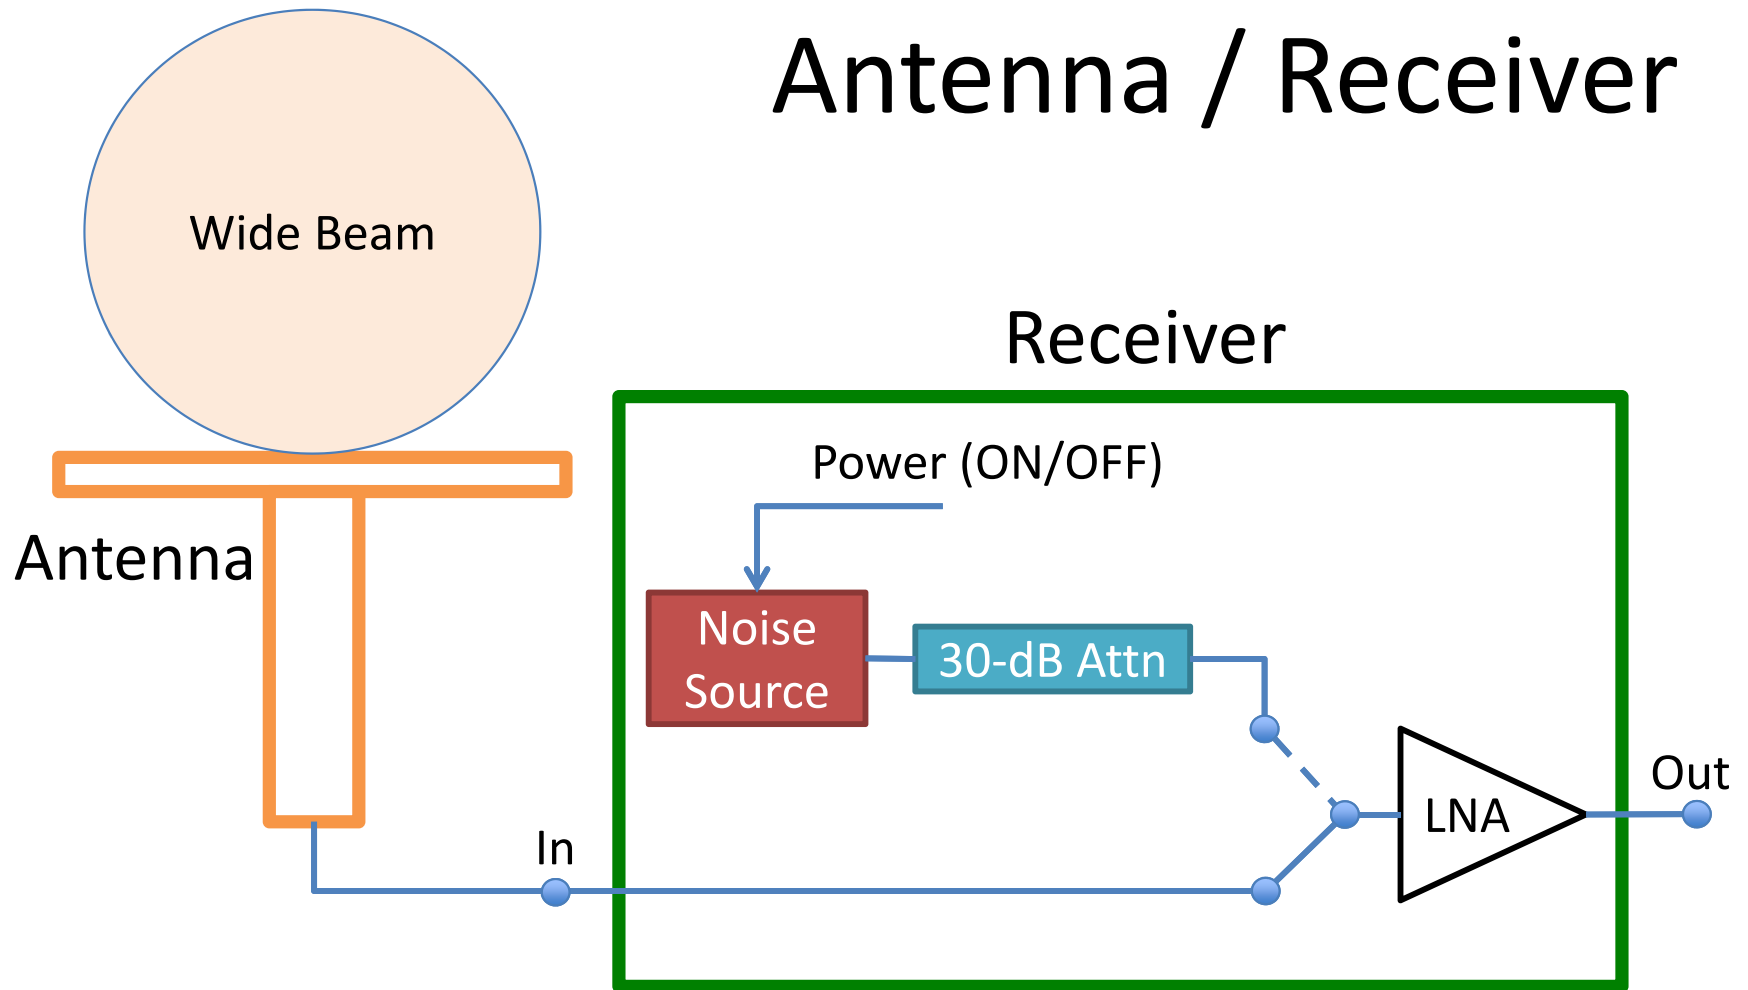

# EDGES **Low-Band** 2015

# EDGES **Low-Band** 2015

# Antenna / Receiver

# Calibration Equations

Uncalibrated Antenna Temperature:

$T^*$ : From **Internal Hot/Cold** Calibration

Calibrated Antenna Temperature:

$$T_{ANT} = (C_1 T^* + C_2) K_B - T_U K_U - T_C K_C - T_S K_S$$

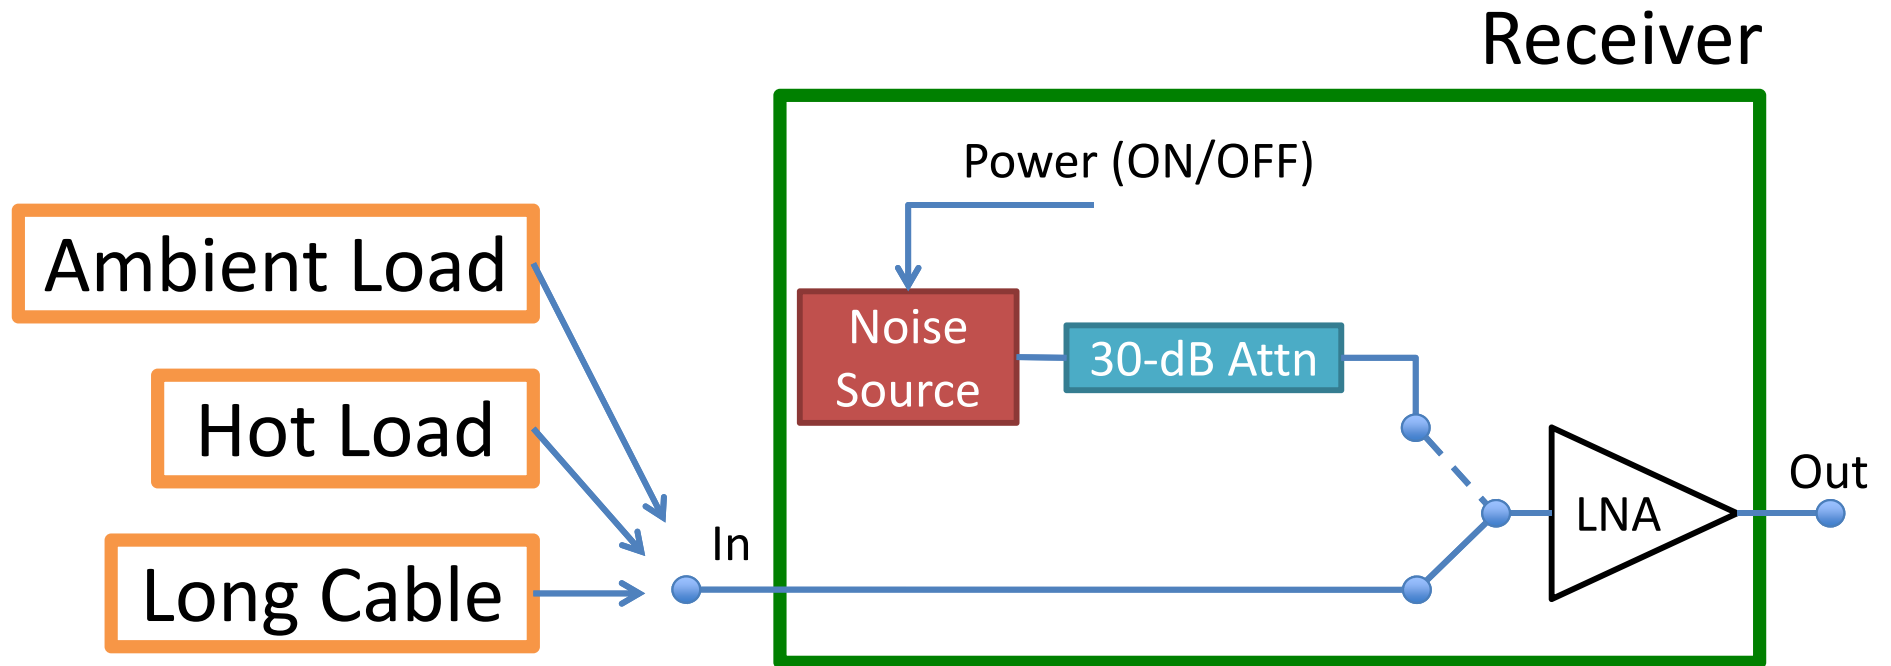

$K_B, K_U, K_C, K_S$

Encode **Reflections** between  
Antenna and Receiver

$C_1, C_2, T_U, T_C, T_S$

Calibration quantities obtained from  
Lab Measurements

# Lab Calibration

# 24-Hr **Low-Band** Calibrated Measurement

# Status of Analysis

$$\begin{aligned} \text{Antenna Temperature} &= \text{Cosmological Signal} \\ &+ (\text{Antenna Beam}) \otimes (\text{Foregrounds} + \text{Ionosphere}) \\ &+ \text{Antenna Losses} + \text{Ground Losses} \\ &+ \text{Calibration Systematics} \end{aligned}$$

One of the **efforts** on the **instrumental** side:

- Improving **modeling** and **removal** of antenna and ground **losses**.
