

Model Driven Ionospheric Corrections for Radio Telescopes

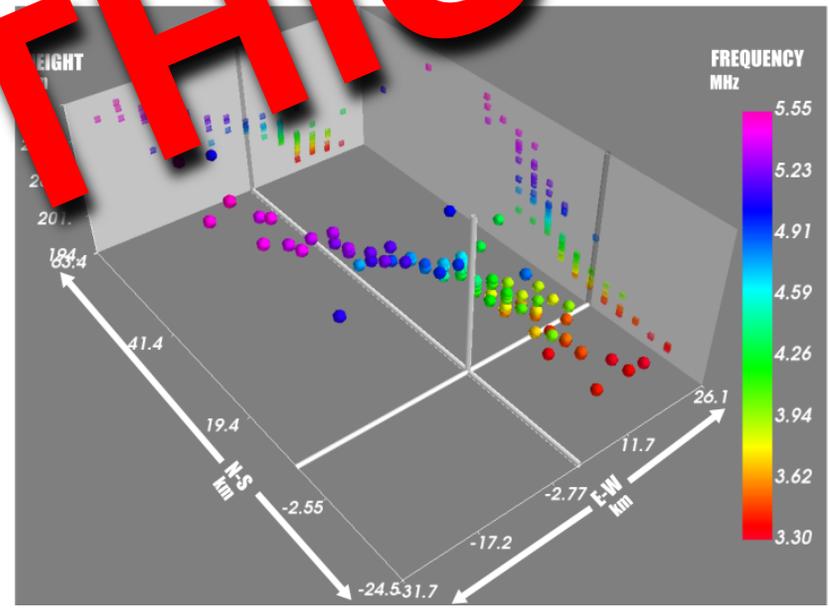

*How a bunch of astronomers helped
me build an ionospheric correction*

Joe Malins
Greg Taylor
Ken Obenberger
Jayce Dowell

NOT THIS

Challenges

Two Questions:

→ Identify What correction is required to the station

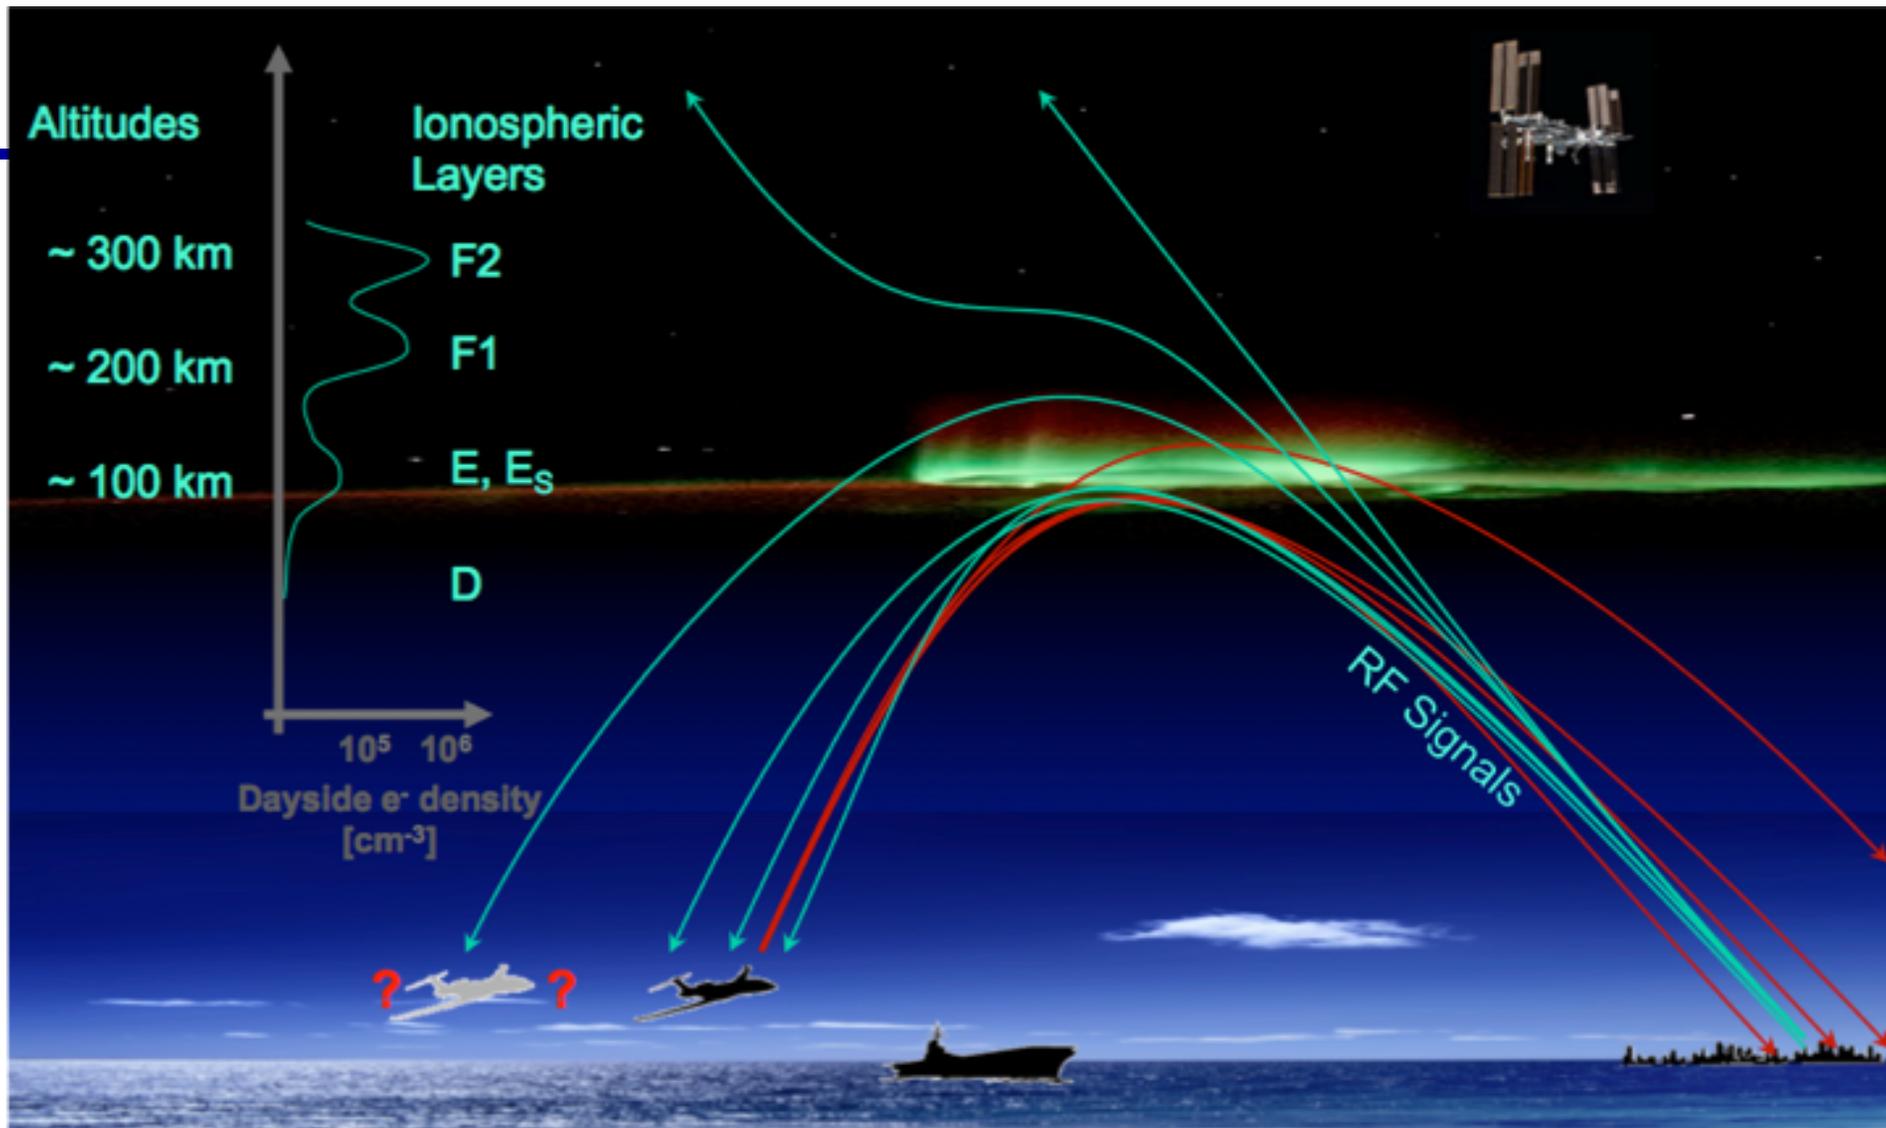

- ◆ Self correcting model from data

- ◆ External Model with outside input (GPS, etc.)

- ◆ Hybrid

→ Impliment the correction into the data

- ◆ At what step is correction implemented into the process

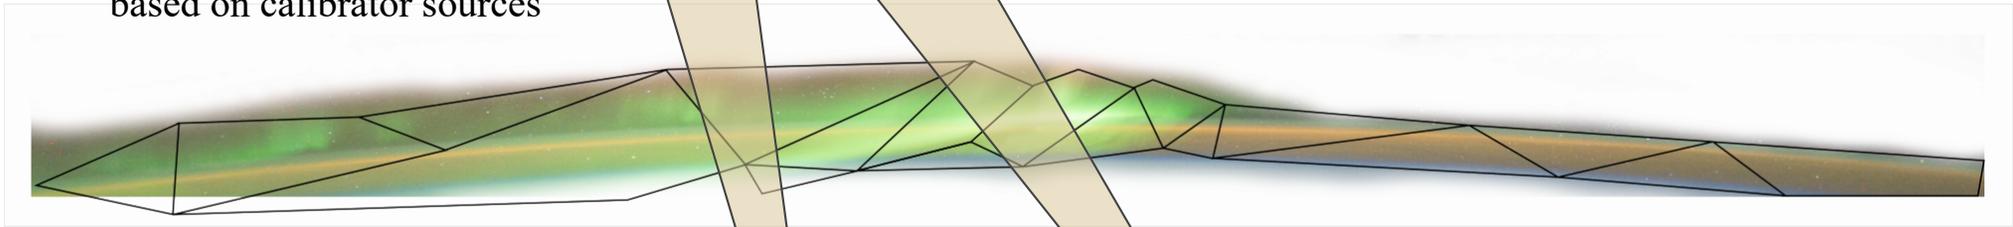

Courtesy NRL <https://www.nrl.navy.mil>

Traditional Correction

Model created from observations

Sky broken into various sections based on calibrator sources

Correction then applied as phase correction to stations

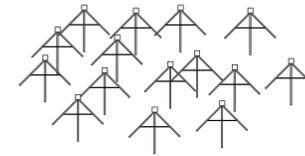

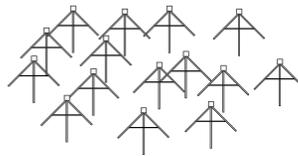

Image Mapping Correction

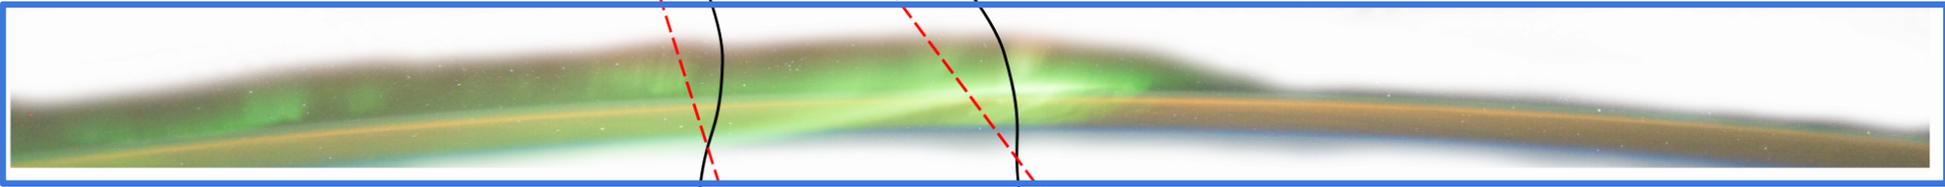

Ray Tracing Through The Atmosphere

Appleton-Hartree Equation

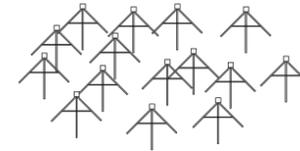

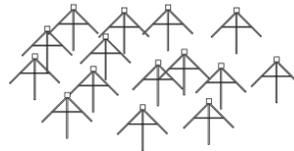

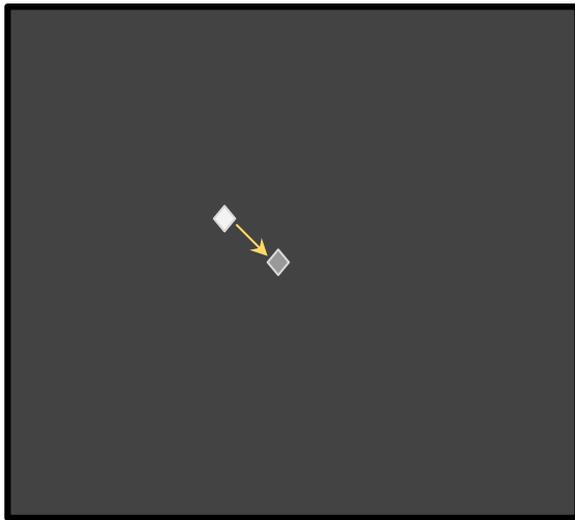

$$n^2 = 1 - \frac{X(1-X)}{1-X - \frac{1}{2}Y^2 \sin^2 \theta \pm \left(\left(\frac{1}{2}Y^2 \sin^2 \theta \right)^2 + (1-X)^2 Y^2 \cos^2 \theta \right)^{1/2}}$$

$$X = \frac{\omega_p^2}{\omega^2} \quad Y = \frac{\omega_H}{\omega}$$

MODEL

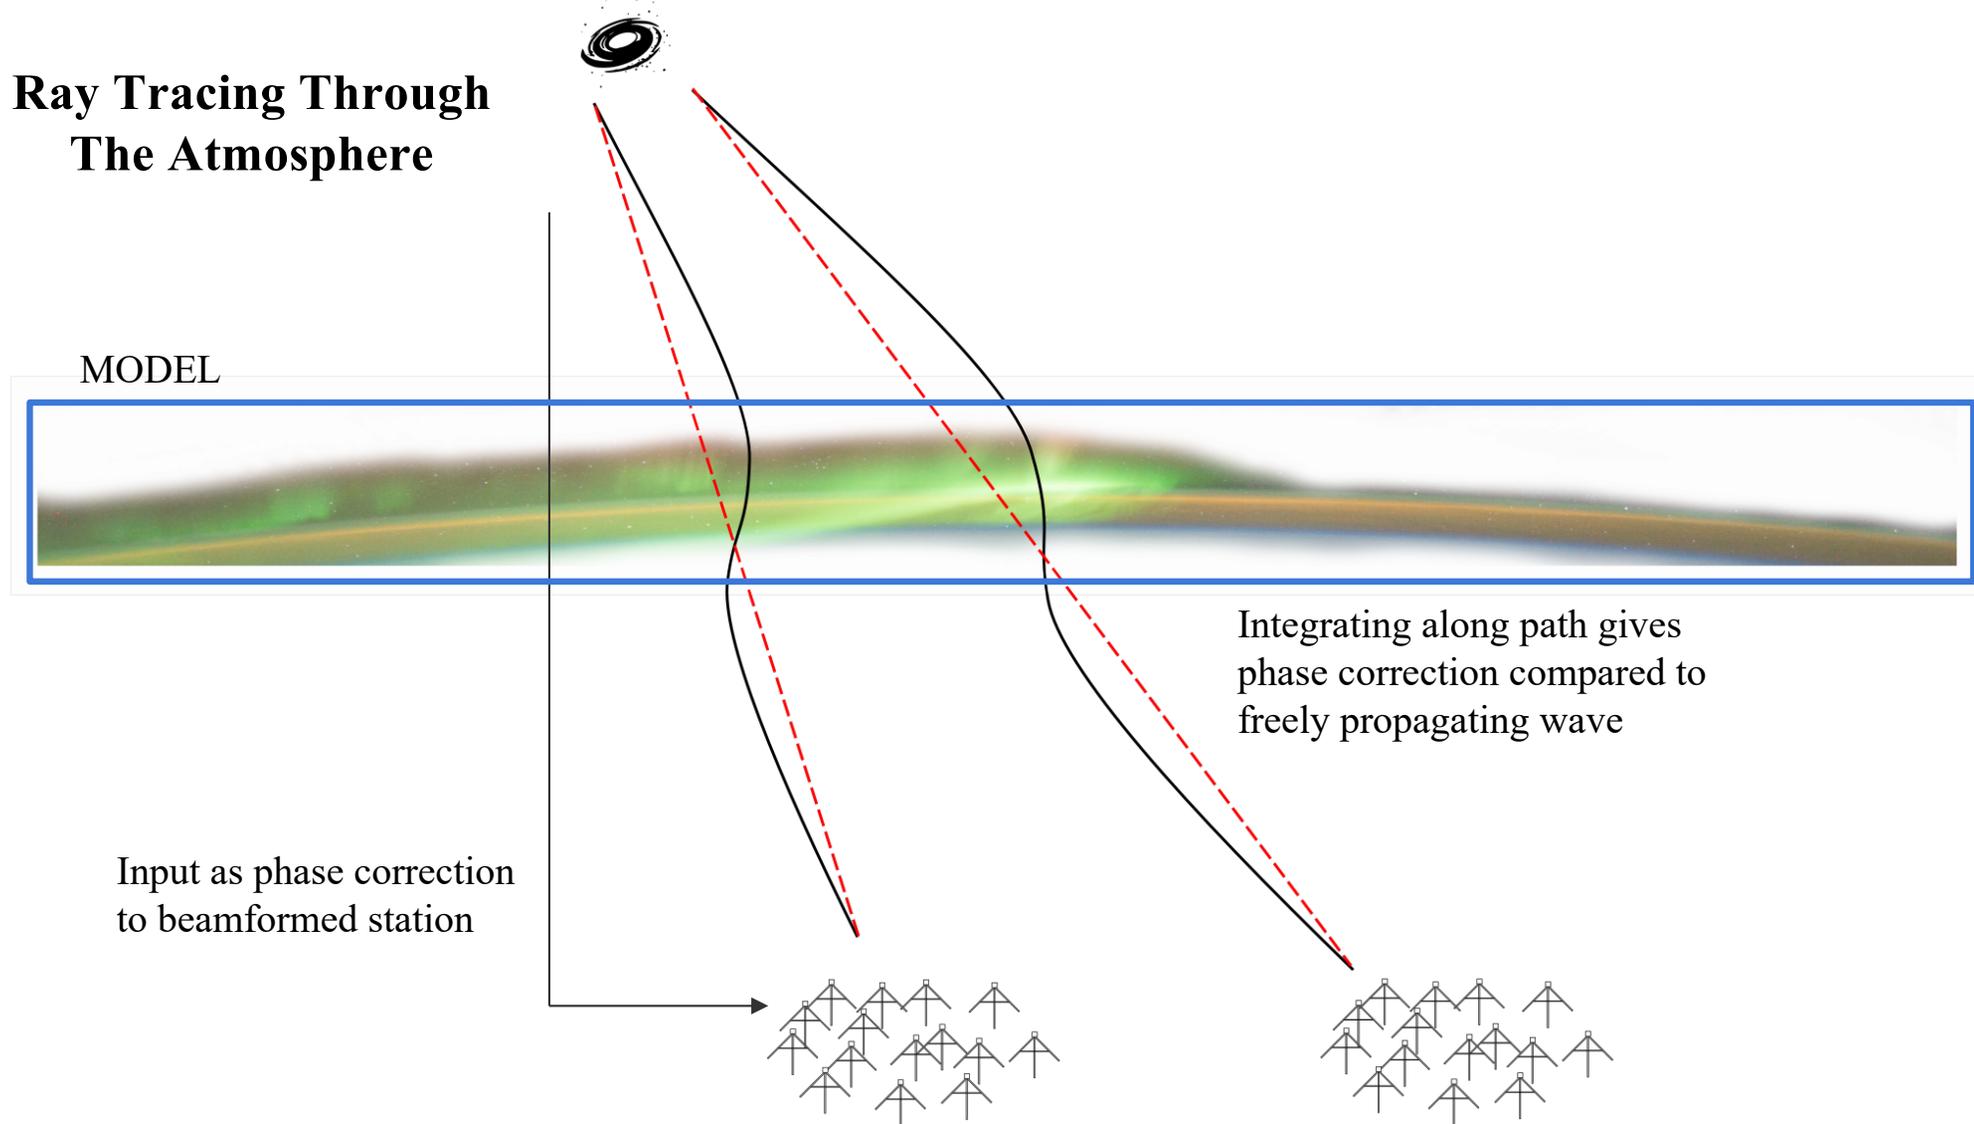

Integrating along path gives phase correction compared to freely propagating wave

Ray Tracing Through The Atmosphere

Ray Tracing Through The Atmosphere

Model

GPSII: GPS Ionosphere Inversion Model

- Assimilative model
- Accepts GPS, Digisonde, Known Reference Point
- Local to Regional Model
- Second Time Step
- Generates 3D plasma frequency map

Implement the correction into the data with ray tracer

- Can be combined with IGRF data

Final Thoughts

- Ray Tracing Does Not Provide Wave Effects (Won't predict scintillation)
- Realtime vs Post Processing
- Time and Space Resolution
- Sources of Data: GPS, digisonde, beacon, integrate LWA?
- LWA astronomic observations integrated into GPSII
